

Fixed prosthesis adhesive metal-free: Literature review

Abstract

Due to great demand for restorations that resemble natural teeth by society and the lower biocompatibility of metal alloys used in the manufacture of conventional denture adhesives and with the improvement of the mechanical and aesthetic properties of these materials that have characteristics almost similar to the a dental structure, we can replace the restorative materials for metal-free materials, provided that the limit of each restorer to be worked, it is necessary that the professional has an adequate command of the technical system is respected.
