

Semidirect onlays: When to indicate?

Abstract

Indirect restorations have been a frequent option of treatment, especially in posterior teeth, due to good esthetic and functional results. This research had the objective to seek additional information on this topic in order to help the decision making process on how and when to indicate semidirect onlays. It was exposed the selection of materials available for the preparation of these restorations and pointed out their advantages, disadvantages, preparation techniques and cementation. As well as their indications and contraindications.
